MM54HC257/MM74HC257 Quad 2-Channel TRI-STATE® Multiplexer

MM54HC257/MM74HC257 Quad 2-Channel TRI-STATE® Multiplexer

General Description

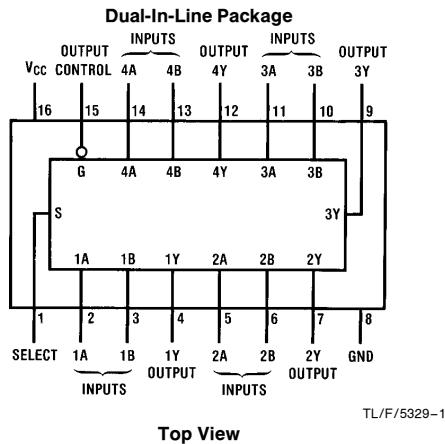

This QUAD 2-TO-1 line data selector/multiplexer utilizes advanced silicon-gate CMOS technology. Along with the high noise immunity and low power dissipation of standard CMOS integrated circuits, it possesses the ability to drive up to 15 LS-TTL loads. The large output drive capability coupled with the TRI-STATE feature make this device ideal for interfacing with bus lines in a bus organized system. When the OUTPUT CONTROL input line is taken high, the outputs of all four multiplexers are sent into a high impedance state. When the OUTPUT CONTROL line is low, the SELECT input chooses whether the A or B input is used.

The 54HC/74HC logic family is speed, function, and pin-out compatible with the standard 54LS/74LS logic family. All inputs are protected from damage due to static discharge by internal diode clamps to V_{CC} and ground.

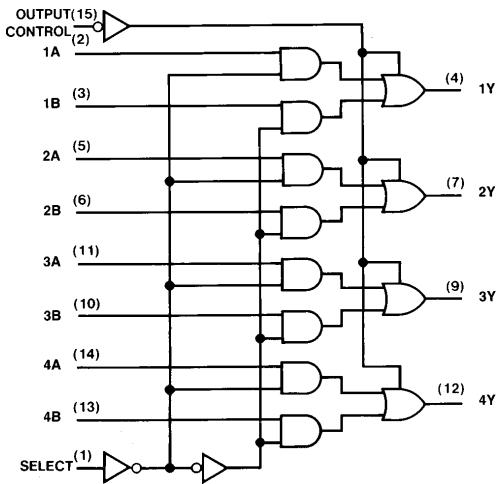

Features

- Typical propagation delay: 12 ns
- Wide power supply range: 2V–6V
- Low quiescent current: 80 μ A maximum (74HC Series)
- TRI-STATE outputs for connection to system buses.

Truth Table

Output Control	Inputs			Output Y
	Select	A	B	
H	X	X	X	Z
L	L	L	X	L
L	L	H	X	H
L	H	X	L	L
L	H	X	H	H

H = high level, L = low level, X = irrelevant, Z = high impedance, (off)

Note 1: Absolute Maximum Ratings are those values beyond which damage to the device may occur.

Note 2: Unless otherwise specified all voltages are referenced to ground.

Note 3: Power Dissipation temperature derating — plastic "N" package: −12 mW/°C from 65°C to 85°C; ceramic "J" package: −12 mW/°C from 100°C to 125°C.

Note 4: For a power supply of 5V ±10% the worst case output voltages (V_{OH} and V_{OL}) occur for HC at 4.5V. Thus the 4.5V values should be used when designing with this supply. Worst case V_{IH} and V_{IL} occur at $V_{CC} = 5.5V$ and 4.5V respectively. (The V_{IH} value at 5.5V is 3.85V.) The worst case leakage current (I_{IN} , I_{CC} , and I_{OZ}) occur for CMOS at the higher voltage and so the 6.0V values should be used.

** V_{IL} limits are currently tested at 20% of V_{CC} . The above V_{IL} specification (30% of V_{CC}) will be implemented no later than Q1, CY'89.
